1.0 INTRODUCTION

The work presented in this report is a continuation of work started under NASC Contract No. 00019-68-C-0274, Collocation Flutter Analysis Study. This work, which is presented in three volumes, is to update and document computer automated flutter analysis techniques. The volumes contain:

Volume I	-	Subsonic Strip Theory Unsteady Aerodynamics Program (Strip) Supersonic Piston Theory Unsteady Aerodynamics Program (Piston)
Volume II	-	Unsteady Aerodynamics Generalized Force Programs for the Subsonic, Sonic and Supersonic Flight Regimes
Volume III	-	Structural Analysis Program - FLUENC-100C Component Mode Synthesis Program (COMSYN) Modal Flutter Analysis Program (MOFA)

The report contains a set of instruction manuals with sufficient information to operate each program. The programs are coded in Fortran IV, and require only a minimum amount of modification to be operable on most computers.

The two programs presented in Volume I, the Subsonic Strip Theory Unsteady Aerodynamics Program and Supersonic Piston Theory Unsteady Aerodynamics Program, calculate unsteady aerodynamic influence coefficients, AICs. These AICs can be used directly as input for the Collocation Flutter Analysis Program presented in Volume IV of Reference 1; and when transformed into generalized aerodynamic forces, they can satisfy the input requirements for the Modal Flutter Analysis Program described in Volume III of this report. The programs were developed using the strip theory approach so that chordwise camber could be incorporated into the analysis. The subsonic program is applicable to wings of moderate to high aspect ratios. The supersonic program is applicable to wings of all aspect ratios; however, for wings of low aspect ratio, it is recommended that the computer program presented in Reference 2 be used. This program, uses a normal mode analysis technique, which is inherently less accurate than the AIC-Collocation Method. However, the deformation modes of wings of low aspect ratio are more accurately described in the modal analysis. It is for this reason that the normal mode method is recommended for wings of low-aspect ratio.

2.0 SUBSONIC STRIP THEORY AERODYNAMICS PROGRAM

2.1 THEORETICAL DEVELOPMENT

It is desirable to consider the derivations of the AIC's in the simplest form, that is from a strip theory approach in which the flow along any section of the wing can be considered two dimensional. The derivation for the rigid chord shown is taken from Reference 3. The derivation for the flexible chord is an extension of the rigid chord case and is developed in a parallel manner. Three basic relationships must be established to obtain AIC's from any aerodynamic theory; they are (1) the pressure-downwash relation; (2) force-pressure relation; and (3) downwash-deflection relation. For the strip theory case the pressure-downwash relationships are available in an equivalent form. Theodorsen (Ref. 4) has integrated the pressure relationships and has presented the above information as a tabulation of oscillatory coefficients; L, M, N, T. The force-pressure relationship is established through the oscillatory coefficients and a corelation of the force systems in Figs. 2.1.1 a & b. The downwash-deflection relationship is established through the geometrical relationships shown in Figs. 2.1.1 a & b.

In the case of strip theory, the matrix of AIC's appears in a partitioned form. For example, the AIC's for the two-strip wing appear as

$$C_h = \left[\begin{array}{c|c} C_{h1} & 0 \\ \hline 0 & C_{h2} \end{array}\right]$$

where the C_{hi} are the AIC's for strip "i". Thus it is only necessary to derive in general form the AIC's for one strip. This is then applied to each strip, and the complete matrix is compiled as shown above.

A survey of two-dimensional oscillatory aerodynamic theory yielded the incompressible solutions of Theodorsen, Ref. 4, and of Theodorsen and Garrick, Refs. 5,6, and the tabulations of Smilg and Wasserman, Ref. 7. The subsonic solution has been tabulated by Timman, Van de Vooren, and Griedanus, Ref. 8. These solutions are for the case of a rigid airfoil and control surface. The incompressible solution for the case of a flexible chord undergoing parabolic changes in camber has been obtained by Spielberg, Ref. 9. The incompressible case for the cambering airfoil with control surface was solved by Tyler, Ref. 10.

Rigid Chord

The theory is developed for the general case with control surface, and degenerates to a second order matrix (upper left partition) for the non-control surface configuration.

DEFINITION

$$\{F\} = \rho \omega^2 b_r^2 s \left[C_h\right] \{h\} \qquad 2.1.1$$

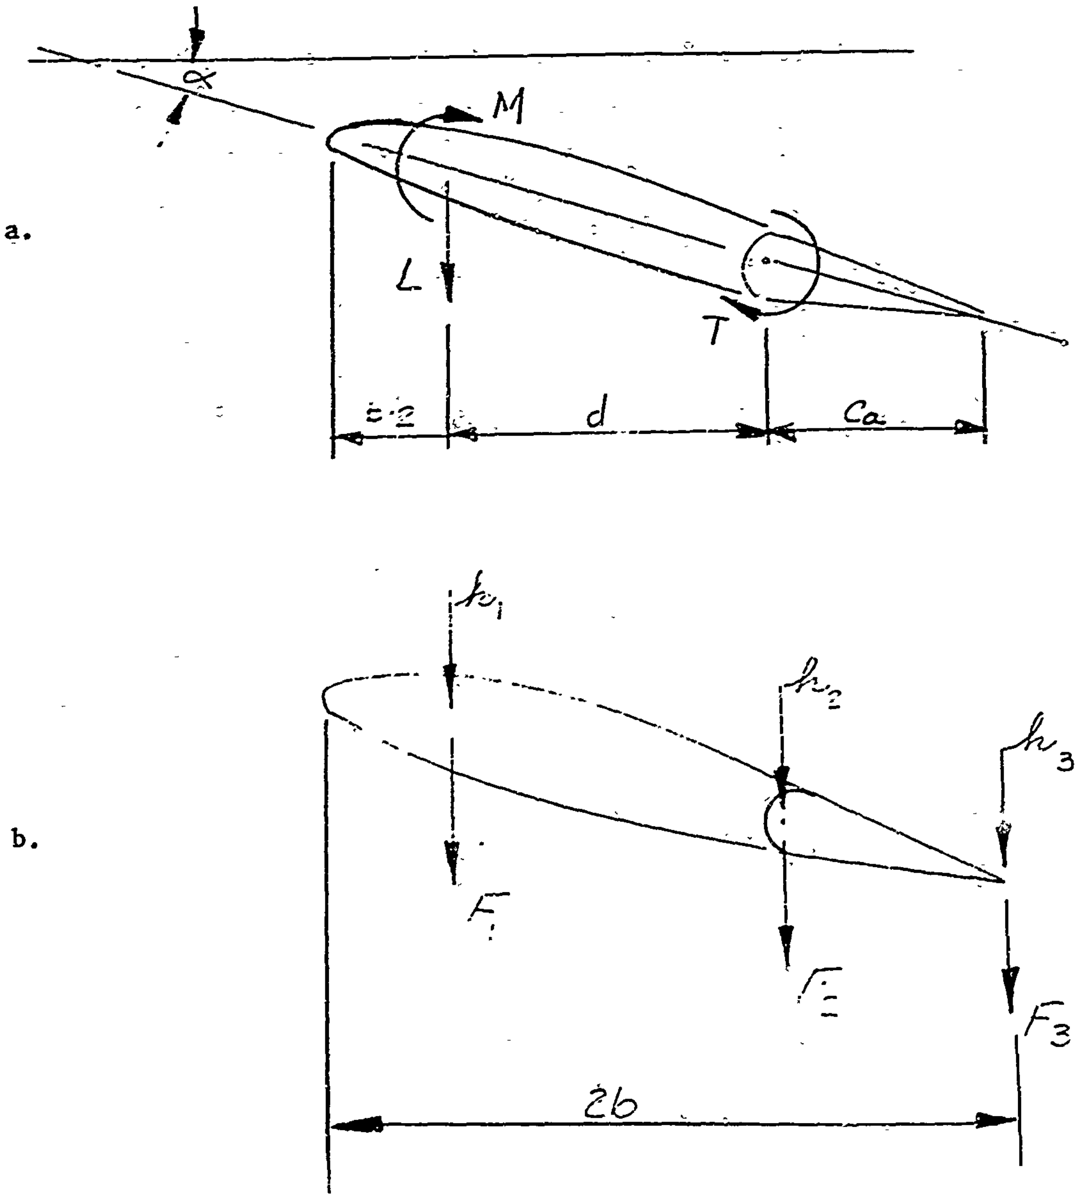

Figure 2.1.1

The force-pressure relationship derived from Fig. 2.1.1 is

$$\left[\begin{array}{cc|c} 1 & 1 & 1 \\ 0 & d & (d+c_a) \\ \hline 0 & 0 & c_a \end{array}\right] \left\{\begin{array}{c} F_1 \\ F_2 \\ \hline F_3 \end{array}\right\} = \left\{\begin{array}{c} L \\ M \\ \hline T \end{array}\right\} \qquad 2.1.2$$

from Ref. 4, the oscillatory coefficients are defined as

$$\left\{\begin{array}{c} L \\ M \\ \hline T \end{array}\right\} = \pi \cos \Lambda \rho \omega^2 b^2 \Delta y \left[\begin{array}{cc|c} 1 & 0 & 0 \\ 0 & b & 0 \\ \hline 0 & 0 & b \end{array}\right] \left[\begin{array}{cc|c} L_h & L_\alpha & L_\beta \\ M_h & M_\alpha & M_\beta \\ \hline T_h & T_\alpha & T_\beta \end{array}\right] \left\{\begin{array}{c} h \\ b\alpha \\ \hline b\beta \end{array}\right\} \qquad 2.1.3$$

The geometrical relationship between the downwash and the deflection as derived from Fig. 2.1.1 is

$$\left\{\begin{array}{c} h \\ b\alpha \\ \hline b\beta \end{array}\right\} = \left[\begin{array}{cc|c} 1 & 0 & 0 \\ -b/d & b/d & 0 \\ \hline b/d & -(b/d+b/c_a) & b/c_a \end{array}\right] \left\{\begin{array}{c} h_1 \\ h_2 \\ h_3 \end{array}\right\} \qquad 2.1.4$$

Substituting 2.1.4 into 2.1.3 and the result into 2.1.2, inverting and multiplying, we get

$$\left\{\begin{array}{c} F_1 \\ F_2 \\ \hline F_3 \end{array}\right\} = \pi \cos\Lambda \rho\omega^2 b^2 \; \Delta y \left[\begin{array}{cc|c} 1 & -b/d & b/d \\ 0 & b/d & -(b/d+b/c_a) \\ \hline 0 & 0 & b/c_a \end{array}\right] \left[\begin{array}{cc|c} L_h & L_\alpha & L_\beta \\ M_h & M_\alpha & M_\beta \\ \hline T_h & T_\alpha & T_\beta \end{array}\right] \left[\begin{array}{cc|c} 1 & 0 & 0 \\ -b/d & b/d & 0 \\ \hline b/d & -(b/d+b/c_a) & b/c_a \end{array}\right]$$

2.1.5

Comparing 2.1.5 with 2.1.1 we see that

$$\left[C_h\right] = \pi \cos\Lambda \, (b/b_r)^2 (\Delta y/s) \left[\begin{array}{cc|c} 1 & -b/d & b/d \\ 0 & b/d & -(b/d+b/c_a) \\ \hline 0 & 0 & b/c_a \end{array}\right] \left[\begin{array}{cc|c} L_h & L_\alpha & L_\beta \\ M_h & M_\alpha & M_\beta \\ \hline T_h & T_\alpha & T_\beta \end{array}\right] \left[\begin{array}{cc|c} 1 & 0 & 0 \\ -b/d & b/d & 0 \\ \hline b/d & -(b/d+b/c_a) & b/c_a \end{array}\right] \qquad 2.1.6$$

Flexible Chord with Parabolic Camber

The theory is developed for the general case with control surface and degenerates to a third order matrix (upper left partition) when the control surface is absent.

Using virtual work to establish the force-pressure relation

$$\delta W = L\delta h_{c/4} + M\delta\alpha + N\delta\zeta + T\delta\beta \qquad 2.1.7a$$

$$= \begin{Bmatrix} \delta h_{c/4} \\ b\delta\alpha \\ \delta\zeta \\ b\delta\beta \end{Bmatrix}^T \begin{Bmatrix} L \\ M/b \\ N \\ T/b \end{Bmatrix} \qquad 2.1.7b$$

$$\delta W = F_1\delta h_1 + F_2\delta h_2 + F_3\delta h_3 + F_4\delta h_4 \qquad 2.1.8a$$

$$= \begin{Bmatrix} \delta h_1 \\ \delta h_2 \\ \delta h_3 \\ \delta h_4 \end{Bmatrix}^T \begin{Bmatrix} F_1 \\ F_2 \\ F_3 \\ F_4 \end{Bmatrix} \qquad 2.1.8b$$

$$\begin{Bmatrix} \delta h_1 \\ \delta h_2 \\ \delta h_3 \\ \delta h_4 \end{Bmatrix}^T \begin{Bmatrix} F_1 \\ F_2 \\ F_3 \\ F_4 \end{Bmatrix} = \begin{Bmatrix} \delta h_{c/4} \\ b\delta\alpha \\ \delta\zeta \\ b\delta\beta \end{Bmatrix}^T \begin{Bmatrix} L \\ M/b \\ N \\ T/b \end{Bmatrix} \qquad 2.1.9$$

Substituting the oscillatory coefficients as defined in Ref. 9

$$= \pi \rho \omega^2 b^2 \Delta y \begin{Bmatrix} \delta h_{c/4} \\ b\delta\alpha \\ \delta\zeta \\ b\delta\beta \end{Bmatrix}^T \begin{bmatrix} L_h & L_\alpha & L_\zeta & L_\beta \\ M_h & M_\alpha & M_\zeta & M_\beta \\ N_h & N_\alpha & N_\zeta & N_\beta \\ T_h & T_\alpha & T_\zeta & T_\beta \end{bmatrix} \begin{Bmatrix} h_{c/4} \\ b\alpha \\ \zeta \\ b\beta \end{Bmatrix} \qquad 2.1.10$$

The downwash deflection relationship can be expressed as,

$$\begin{Bmatrix} h_{c/4} \\ b\alpha \\ \zeta \\ b\beta \end{Bmatrix} = \begin{bmatrix} A \end{bmatrix} \begin{Bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{Bmatrix} \quad \text{where (A) is to be defined later.} \qquad 2.1.11a$$

Taking the transpose, we obtain

$$\begin{Bmatrix} h_{c/4} \\ b\alpha \\ \zeta \\ b\beta \end{Bmatrix}^T = \begin{Bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{Bmatrix}^T \begin{bmatrix} A \end{bmatrix}^T \qquad 2.1.11b$$

Substituting 2.1.11b into 2.1.10 to obtain

$$\begin{Bmatrix} F_1 \\ F_2 \\ F_3 \\ F_4 \end{Bmatrix} = \pi \rho \omega^2 b^2 \Delta y \begin{bmatrix} A \end{bmatrix}^T \begin{bmatrix} L_h & L_\alpha & L_\zeta & L_\beta \\ M_h & L_\alpha & M_\zeta & M_\beta \\ N_h & N_\alpha & N_\zeta & N_\beta \\ T_h & T_\alpha & T_\zeta & T_\beta \end{bmatrix} \begin{bmatrix} A \end{bmatrix} \begin{Bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{Bmatrix} \qquad 2.1.12$$

or $$\{F\} = \pi \rho \omega^2 b^2 \Delta y \begin{bmatrix} A \end{bmatrix}^T \begin{bmatrix} L \end{bmatrix} \begin{bmatrix} A \end{bmatrix} \qquad 2.1.13$$

therefore

$$\begin{bmatrix} C_h \end{bmatrix} = \pi (b^2 \Delta y / b_r^2 s) \begin{bmatrix} A \end{bmatrix}^T \begin{bmatrix} L \end{bmatrix} \begin{bmatrix} A \end{bmatrix} \qquad 2.1.14$$

<u>Development of the [A] matrix.</u>

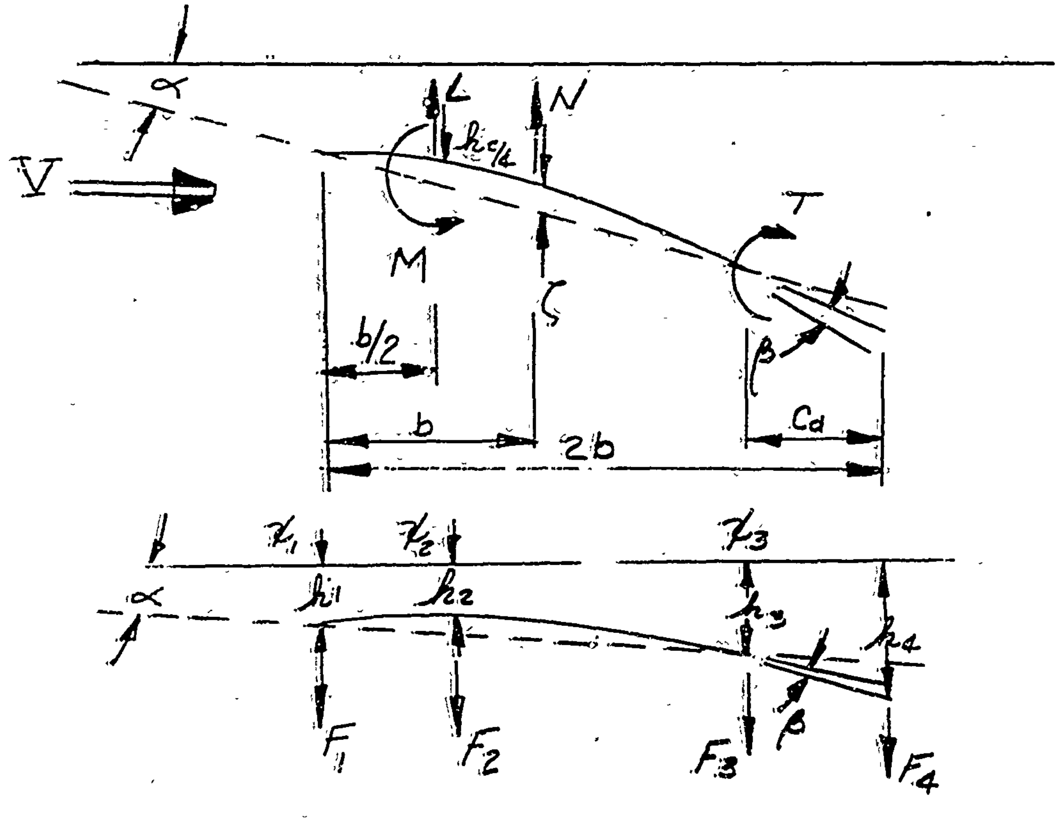

Figure 2.1.2

Using Lagrangian Curve Fit with Figure 2.1.2

$$h(x) = h_1 \frac{(x-x_2)\ (x-x_3)}{(x_1-x_2)\ (x_1-x_3)} + h_2 \frac{(x-x_1)\ (x-x_3)}{(x_2-x_1)\ (x_2-x_3)} + h_3 \frac{(x-x_1)\ (x-x_2)}{(x_3-x_1)\ (x_3-x_2)} \qquad 2.1.15$$

$$h'(x) = h_1 \frac{2x - x_2 - x_3}{(x_1-x_2)\ (x_1-x_3)} + h_2 \frac{2x-x_1-x_3}{(x_2-x_1)\ (x_2-x_3)} + h_3 \frac{2x-x_1-x_2}{(x_3-x_1)\ (x_3-x_2)} \qquad 2.1.16$$

We can now relate h_1, h_2, h_3, h_4 to $h_{c/4}$, $b\alpha$, ζ, $b\beta$

$$h_{\ell e} = \{h_{\ell e}/h_1\}\ h_1 + \{h_{\ell e}/h_2\}\ h_2 + \{h_{\ell e}/h_3\}\ h_3$$

$$h_{c/2} = \{h_{c/2}/h_1\}\ h_1 + \{h_{c/2}/h_2\}\ h_2 + \{h_{c/2}/h_3\}\ h_3$$

$$h_{te} = \{h_{te}/h_1\}\ h_1 + \{h_{te}/h_2\}\ h_2 + \{h_{te}/h_3\}\ h_3 \qquad 2.1.17$$

where we have used the following notations

$$\{h_{\ell e}/h_1\} = (x_{\ell e}-x_2)\ (x_{\ell e}-x_3)\ (x_1-x_2)\ (x_1-x_3)$$

$$\{h_{\ell e}/h_2\} = (x_{\ell e}-x_1)\ (x_{\ell e}-x_3)\ (x_2-x_1)\ (x_2-x_3)$$

$$\{h_{\ell e}/h_3\} = (x_{\ell e}-x_1)\ (x_{\ell e}-x_2)\ (x_3-x_1)\ (x_3-x_2)$$

$$\{h_{c/2}/h_1\} = (x_{c/2}-x_2)\ (x_{c/2}-x_3)\ (x_1-x_2)\ (x_1-x_3)$$

$$\{h_{c/2}/h_2\} = (x_{c/2}-x_1)\ (x_{c/2}-x_3)\ (x_2-x_1)\ (x_2-x_3)$$

$$\{h_{c/2}/h_3\} = (x_{c/2}-x_1)\ (x_{c/2}-x_1)\ (x_3-x_1)\ (x_3-x_2)$$

$$\{h_{te}/h_1\} = (x_{te}-x_2)\ (x_{te}-x_3)\ (x_1-x_2)\ (x_1-x_3)$$

$$\{h_{te}/h_2\} = (x_{te}-x_1)\ (x_{te}-x_3)\ (x_2-x_1)\ (x_2-x_3)$$

$$\{h_{te}/h_3\} = (x_{te}-x_1)\ (x_{te}-x_2)\ (x_3-x_1)\ (x_3-x_2)$$

2.1.18

$$h_{c/4} = \tfrac{1}{4}(3h_{\ell e} + h_{te})$$

$$= \{h_{c/4}/h_1\}\, h_1 + \{h_{c/4}/h_2\}\, h_2 + \{h_{c/4}/h_3\}\, h_3 \qquad 2.1.19$$

where

$$h_{c/4}/h_i = (3/4)h_{\ell e}/h_i + (1/4)\, h_{te}/h_i, \quad i = 1,2,3 \qquad 2.1.20$$

$$b\alpha = (1/2)(h_{te} - h_{\ell e})$$

$$= \{\beta\alpha/h_1\}h_1 + \{b\alpha/h_2\}h_2 + \{b\alpha/h_3\}\, h_3 \qquad 2.1.21$$

where $b\alpha/h_i = (1/2)\ (h_{te}/h_i - h_{\ell e}/h_i), \quad i = 1,2,3 \qquad 2.1.22$

$$\zeta = h_{c/2} = (1/2)\ (h_{e} + h_{te})$$

$$= \{\zeta/h_1\}\, h_1 + \{\zeta/h_2\}\, h_2 + \{\zeta/h_3\}\, h_3 \qquad 2.1.23$$

where $\zeta/h_i = h_{c/2}/h_i = (1/2)\ (h_{te}/h_1 + h_{te}/h_i); \quad i = 1,2,3 \qquad 2.1.24$

$$h'(x_3) = \frac{x_3 - x_2}{(x_1 - x_2)(x_1 - x_3)}\, h_1 + \frac{x_3 - x_1}{(x_2 - x_1)(x_2 - x_3)}\, h_2$$

$$+ \frac{2x_3 - x_1 - x_2}{(x_3 - x_1)\ (x_3 - x_2)}\, h_3 \qquad 2.1.25$$

$$b\beta = \frac{b(h_4 - h_3)}{c_a} + bh'(x_3) \qquad 2.1.26$$

$$= \frac{b(x_3 - x_2)}{(x_1 - x_2)(x_1 - x_3)}\, h_1 + \frac{b(x_3 - x_1)}{(x_2 - x_1)(x_2 - x_3)}\, h_2 + \frac{b(2x_3 - x_1 - x_2)}{(x_3 - x_1)(x_3 - x_2)} - \frac{1}{c_a}\, h_3 + \frac{b}{c_a}\, h_4$$

$$b\beta = b\{h'(x_3)/h_1\}\, h_1 + b\, \{h'(x_3)/h_2\} + b\, \{h'(x_3)/h_3\}\, h_3 + \frac{b}{c_a}\, h_4 \qquad 2.1.27$$

where

$$\{h'(x_3)/h_1\} = \frac{(x_3 - x_2)}{(x_1 - x_2)\,(x_1 - x_3)}$$

$$\{h'(x_3)/h_2\} = \frac{(x_3 - x_1)}{(x_2 - x_1)(x_2 - x_3)}$$

$$\{h'(x_3)/h_3\} = \frac{2x_3 - x_1 - x_2}{(x_3 - x_1)(x_3 - x_2)} - \frac{1}{c_a}$$

$$\{h'(x_3)/h_3\} = \frac{1}{c_a} \qquad 2.1.28$$

Thus we may write the geometrical relation matrix.

$$\left\{\begin{matrix} h_{c/4} \\ b\alpha \\ \zeta \\ b\beta \end{matrix}\right\} = \begin{bmatrix} \{h_{c/4}/h_1\} & \{h_{c/4}/h_2\} & \{h_{c/4}/h_2\} & 0 \\ b\{\alpha/h_1\} & b\{\alpha/h_2\} & b\{\alpha/h_3\} & 0 \\ \{\zeta/h_1\} & \{\zeta/h_2\} & \{\zeta/h_3\} & 0 \\ b\{h'(x_3/h_1\} & b\{h'(x_3)/h_2\} & b\{h'(x_3)/h_3\} & b\{h'(x_3)/h_4\} \end{bmatrix} \left\{\begin{matrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{matrix}\right\} \tag{2.1.29}$$

$$\left\{\begin{matrix} h_{c/4} \\ b\alpha \\ \zeta \\ b\beta \end{matrix}\right\} = [A] \left\{\begin{matrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{matrix}\right\} \tag{2.1.30}$$

where the elements of [A] are defined in equation 2.1.29

2.2 PROGRAM DESCRIPTION

A general program to calculate a set of aerodynamic influence coefficients using incompressible strip theory has been developed. The method is applicable to wings of moderate to high aspect ratio and speeds in the subsonic regime. The analysis can be performed for wings with a rigid chord or a flexible chord. The effects of a flexible chord are accounted for by the introduction of parabolic cambering if the bending mode is parabolic and the torsion mode linear in the region surrounding the strip under consideration. The analysis can be performed with or without a control surface. The method used is based upon the most fundamental solution in unsteady flow by Theodorsen for the oscillating two-dimensional airfoil in an incompressible flow and the extensions to include camber by Speilberg and Tyler. The steady state case is available as a limiting case of the oscillating case for use in static aeroelastic analysis. The AICs relate the aerodynamic forces to the surface deflections through the following definitions. In the oscillatory case,

$$\{F\} = \rho\, w^2 b_r^{\,2} \left[C_h\right] \{h\}$$

and in the steady case,

$$\{F\}_s = (1/2)\, \rho V^2\, (S/\bar{c})\, \left[C_{hs}\right]\{h\}$$

The AICs are derived for each strip considering the airfoil to have up to four degrees of freedom: pitching, plunging, cambering, and control surface rotation. The program provides the AICs in printed and optional punched-card output format. The punched-card output satisfies the input requirements of the Collocation Flutter Analysis Program (Ref. 1). The program capacity is 25 surface strips and 50 values of reduced velocity.

2.2.1 PROCESSING INFORMATION

A. OPERATION

Standard FORTRAN IV processor system . Operable on the GE 635 computer.

B. CORE STORAGE

The program STRIP requires a minimum of 20,000 memory units for execution.

C. ADDITIONAL MACHINE COMPONENTS

Standard FORTRAN input tape (5)

Standard FORTRAN output print tape (6)

Standard FORTRAN output punch tape

2.3 INPUT INSTRUCTIONS

UNITS

Since all of the input dimensions are geometrical and the aerodynamic matrix is dimensionless, only a consistent set of length units is necessary - inches or feet.

PROGRAM CAPABILITIES

Analyses can be performed for surfaces with or without cambering and/or with or without a control surface. Analyses can be performed for $1/k_r = 0$ to ∞. $1/k = 0$ is equivalent to zero forward velocity, and yields the aerodynamics associated with a ground vibration test. $1/k_r = \infty$ is equivalent to the steady state flow case, $\omega = 0$. The surface may be divided into as many as 25 strips. The number of reduced velocities used in any one analysis (one input deck) must be ≤ 50. If it is desired to compute the matrix of steady AICs $[C_{hs}]$, a negative value of $1/k_r$ should be supplied to the program (S and $\bar{c}$ must also be provided).

DATA DECK SETUP

1. Title Card 1
2. Title Card 2
3. NCAM, ISZ, JSZ, NØPUNJ
4. $\cos\Lambda, b_r, s, S, \bar{c}$
5. $\Delta y, b, \zeta_1, \zeta_2, \zeta_3$ for each strip
6. $1/k_r$ series

INPUT DATA DESCRIPTION

1. & 2. Title Card 1 and 2 may contain any characters desired in Column 2 through 72. Column 1 should be blank. Characters on these two cards appear at the top of the first page of printed output.

3. Control card (Format 18I4)

Column	1-4	5-8	9-16	17-20
Name	NCAM	ISZ	JSZ	NØPUNJ
Item	(1)	(2)	(3)	(4)

NCAM = 0, Camber not considered in analysis (rigid chord).

= 1, Camber included in analysis.

ISZ = Number of strips ≤ 25

JSZ = Number of reduced velocities ≤ 50

NØPUNJ = 0 ~ $\frac{1}{k_r}$ & $[C_h]$ Punched out

1 ~ No punched output

4. Data Card (Format 6E12.8)

Column	1-12	13-24	25-36	37-48	49-60
Name	C0SLMD	BR	S	CAPS	CBAR
Item	(1)	(2)	(3)	(4)	(5)

C0SLMD = $\cos\Lambda$ = cosine value of the quarter chord sweep angle

BR = b_r = reference semi-chord

S = s = semi-span

CAPS = S = surface area of wing (required only for steady-state analysis)

CBAR = $\bar{c}$ = mean aerodynamic chord of wing (required only for steady-state analysis)

5. Data Card (Format 6E12.8) Repeat for each strip.

Column	1-12	13-23	25-36	37-48	49-60	61-72
Name	DELTAY	$\hat{B}$	Z_1	Z_2	Z_3	
Item	(1)	(2)	(3)	(4)	(5)	

DELTAY = Δy_i = Strip width of strip "i".

B = b_i = Local semichord of strip "i".

Z1 = ζ_{1_i} = Fraction of chord for location of forward control point on strip "i". When NCAM = 0, ζ_1 must equal .25.

Z2 = ζ_{2_i} = Fraction of chord for location second control point on strip "i". ζ_2 is negative for control surface on strip. When NCAM = 0, ζ_2 must be the percent chord that corresponds to the control surface hinge line.

Z3 = ζ_{3_i} = Fraction of chord to third control point on strip "i". When NCAM = 0; ζ_3 must equal zero. When NCAM = 1, ζ_3 must be the percent chord that corresponds to the control surface hinge line.

NOTE: When NCAM = 0 and ζ_2 is negative, ζ_3 is located internally in the program and is placed at the trailing edge (ζ_3 = 1.0).

The distance between the forward and middle control points (d) and the control surface local chord (c_a) are computed internally in the program and are printed along with the strip data in the program output. When NCAM = 1 and ζ_2 is negative, ζ_4 is located internally in the program and is placed at the trailing edge (ζ_4 = 1.0). The control surface local chord (c_a) also is determined internally in the program, and can be found in the printed output with the geometric data for the strip.

6. Data Card - 1/k series (Format 6E12.8)

Column	1-12	13-24	25-36	37-48	49-60	61-72
Name	$1/k_1$	$1/k_2$	. . .	$1/k_i$	. . .	$1/k_{JSZ}$
Item						

$1/k = 1/k_r$ = Reduced velocity $V/b_r w$; continue on successive cards until i = JSZ (6 values per card).

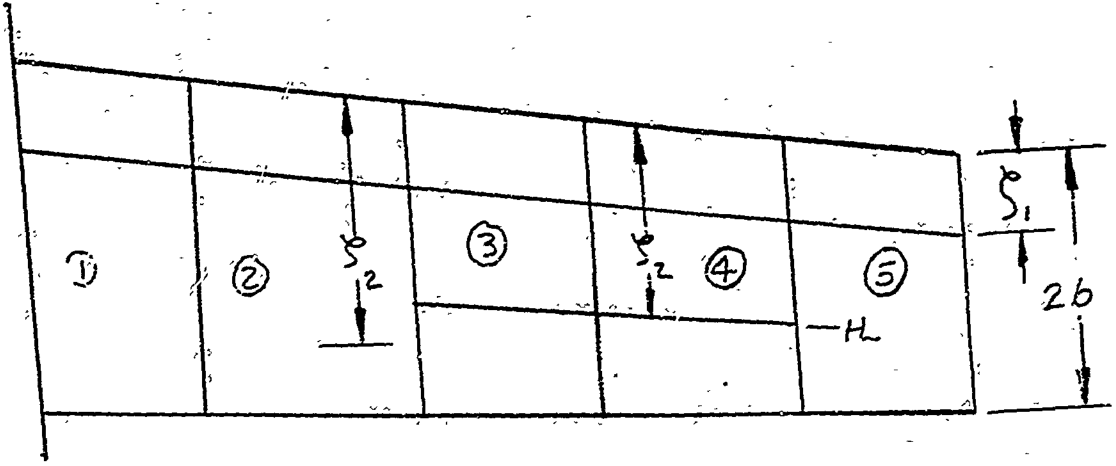
2.4 EXAMPLE PROBLEM

As an example problem, the subsonic AIC's are calculated for the high aspect ratio swept-back wing shown below. The wing is analyzed for the rigid chord case (no camber) and for the flexible chord case (parabolic cambering). The analysis is performed for the reduced frequencies (1/k) of 0,5.0,8.0, and -16.0. A 1/k = 0.0 calculates the aerodynamics associated with a ground vibration test. A negative 1/k calculates aerodynamics associated with steady state flight.

Note: Any number may be used for the steady-state case as long as it is negative.

PROGRAM INPUT DATA

NO CAMBER CASE



STRIP	Δy(ft)	b(ft)	ζ_1	ζ_2
1	3.8	7.5	.25	.803

4	3.2	5.5	.25	-.723
5	3.0	5.0	.25	.700

$\cos\Lambda = .75$

$b_r = 6.0$ ft

$s = 20.0$ ft

$S = 200$ ft^2

$\bar{c} = 15.0$ ft

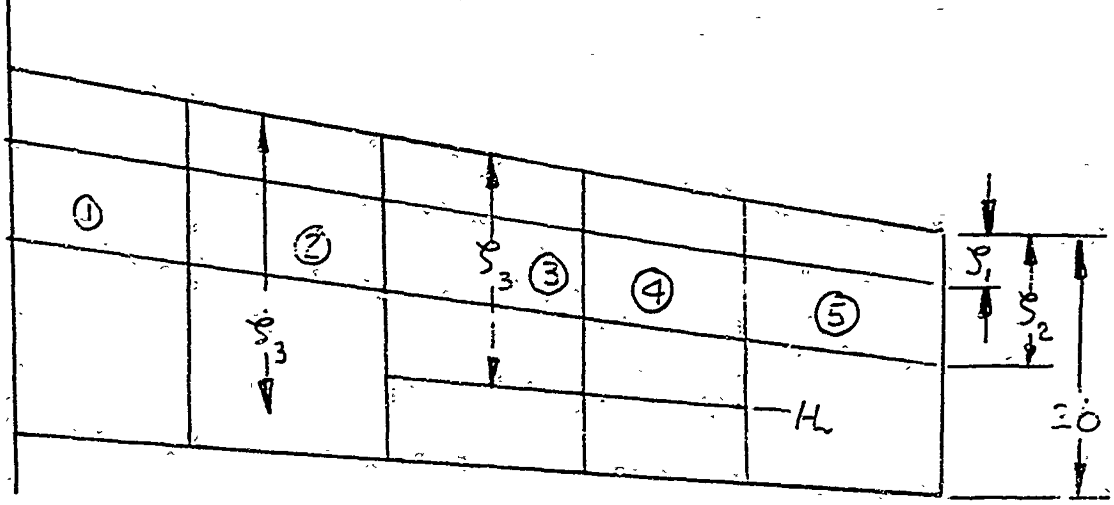
$1/k = 5.0, 8.0, 0.0, -16.0$

ζ_1 must always be the 25% chordline for the no camber case. ζ_2 must be on the hinge line when a control surface is present; when no control surface is present, ζ_2 may be any arbitrary position.

NOTE: Negative ζ_2 for strips 3 and 4 indicates a control surface on these strips.

PROGRAM INPUT DATA

CAMBER CASE



STRIP NO.	ΔY	b(ft)	ζ_1	ζ_2	ζ_3
1	3.8	7.5	.3	.55	.803
2	3.6	6.8	.3	.55	.779
3	3.4	6.2	.3	-.55	.734
4	3.2	5.5	.3	-.55	.723
5	3.0	5.0	.3	.55	.700

$\cos\Lambda$ = .75

b_r = 6.0 ft

s = 20.0 ft

S = 200 ft^2

$\bar{c}$ = 15.0 ft

$1/k$ = 5.0, 8.0, 0.0, -16.0

ζ_1, ζ_2, and ζ_3 may be any arbitrary position when no control surface is present; when a control surface is present, ζ_1 and ζ_2 may be arbitrarily located and ζ_3 must be located at the hinge line. In both cases, however, ζ_1, ζ_2, and ζ_3 should be distributed across the chord so that the chamber can be properly defined, e.g., $\zeta_1 = .20$, $\zeta_2 = .50$, and $\zeta_3 = .80$.

NOTE: Negative ζ_2 for strips 3 and 4 indicates a control surface on these strips.

3.0 PISTON THEORY AERODYNAMICS PROGRAM

3.1 THEORETICAL DEVELOPMENT

The pressure on a lifting surface is normally given by a surface functional relationship. However, in the limits of high Mach number ($M^2 \gg 1$) or high reduced frequency ($M^2k \gg 1$ or $M^2k^2 \gg 1$), this relationship becomes a point function. As a consequence of this limit, aerodynamic influence coefficients (AICs) may be specified exactly by a strip theory, so only a single strip need be considered in the basic development, and control surface and camber effects may be determined in a straightforward manner.

The present formulation derives the AICs from third-order piston theory for a (parabolically) cambering airfoil with or without a (rigid chord) control surface. The derivation differs only slightly from that of Ashley and Zartarian[1] in that in the present case the third-order pressure coefficient is generalized to account for sweep and steady angle of attack, and, following a suggestion of Morgan, Huckel, and Runyan,[2] a correction (optional) is suggested to give agreement with the second-order quasi-steady supersonic theory of Van Dyke.[3] This quasi-steady correction should extend the validity of piston theory to lower supersonic Mach numbers at low reduced frequencies. The derivation given here is a combination and generalization of those given in Ref. 4 for the rigid chord airfoil with control surface and in Ref. 5 for the parabolically cambering airfoil without control surface.

The AICs are defined to relate the surface to the aerodynamic forces at the same points in the oscillatory case by

$$\{F\} = \rho\omega^2 b_r^2 s [C_h]\{h\}$$

and in the steady case by

$$\{F\} = (qS/\bar{c})\left[C_{hs}\right]\{h\}$$

Development of the General Oscillatory Case Including Camber and Control Surface

We wish to determine the AICs that relate the four deflections h_1, h_2, h_3, and h_4 to the forces F_1, F_2, F_3, and F_4 acting at the same points as shown in Fig. 1. If the airfoil has no control surface x_3 may be located arbitrarily; if there is a control surface x_3 must be located at the hinge line and h_4 is the deflection of the trailing edge. The deflections are those of the mean camber line and the control surface is assumed to be rigid.

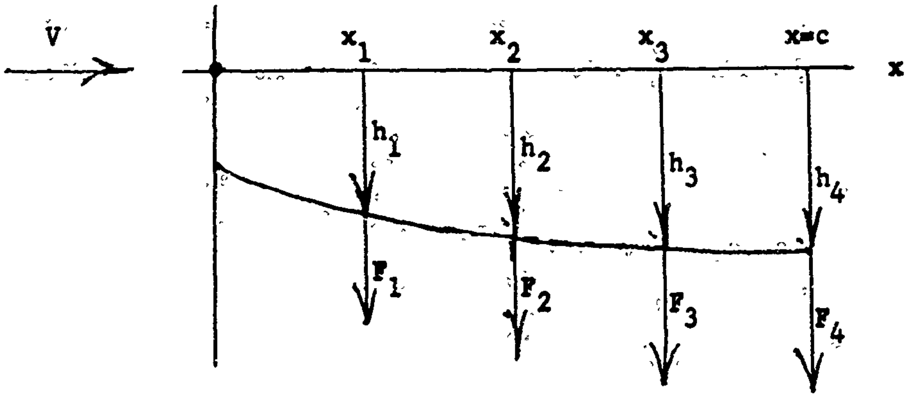

Figure 3.1.1- Forces and Geometry for AICs

We consider two airfoil cross-sections. The first is typical of airfoils employed in missile applications while the second is representative of aircraft applications. The first airfoil consists of three straight lines as shown in Fig. 2. The second consists of two tangent parabolas and a straight line as shown in Fig. 3.

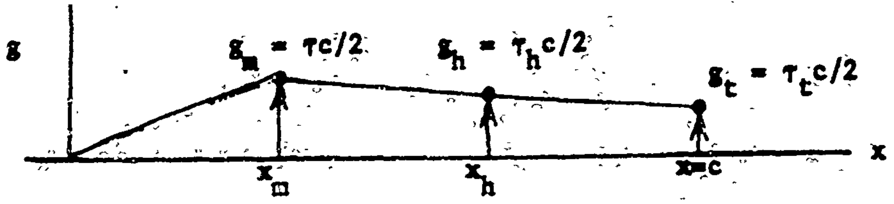

Fig. 3.1.2 — First Airfoil Idealization

Fig. 3.1.3 — Second Airfoil Idealization

The equations for the deflection curve of either airfoil are

$$h = [h(x)/h_1]h_1 + [h(x)/h_2]h_2 + [h(x)/h_3]h_3$$

for $0 \le x \le x_h$, and on the control surface

$$h_c = [h_c(x)/h_3]h_3 + [h_c(x)/h_4]h_4$$

for $x_h \le x \le c$ where

$$h(x)/h_1 = (x-x_2)(x-x_3)/(x_1-x_2)(x_1-x_3)$$

$$h(x)/h_2 = (x-x_1)(x-x_3)/(x_2-x_1)(x_2-x_3)$$

$$h(x)/h_3 = (x-x_1)(x-x_2)/(x_3-x_1)(x_3-x_2)$$

$$h_c(x)/h_3 = (c-x)/(c-x_h)$$

and

$$h_c(x)/h_4 = (x-x_h)/(c-x_h)$$

The equations for the semi-thickness distribution of the first airfoil are

$$g_1(x)/c = (\tau/2)(x/x_m) \quad , \quad 0 \le x \le x_m$$

$$g_2(x)/c = (\tau/2)[1 - (1-r_h)(x-x_m)/(x_h-x_m)] \quad , \quad x_m \le x \le x_h$$

and $$g_3(x)/c = (\tau_h/2)[1 - (1-r_t)(x-x_h)/(c-x_h)] \quad , \quad x_h \le x \le c$$

where the symbols are defined in the Nomenclature. The semi-thickness equations for the second airfoil are

$$g_1(x)/c = (\tau/2)(x/x_m)(2-x/x_m) \quad , \quad 0 \le x \le x_m$$

$$g_2(x)/c = (\tau/2)\{1 - (1-r_h)[(x-x_m)/(x_h-x_m)]^2\} \quad , \quad x_m \le x \le x_h$$

and $$g_3(x)/c = (\tau_h/2)[1 - (1-r_t)(x-x_h)/(c-x_h)] \quad , \quad x_h \le x \le c$$

The linearized lifting pressure coefficient for small disturbances about the trim angle of attack α_o is given in Ref. 4 by

$$C_p = -(4\nu/M)[\bar{C}_1 + 2\bar{C}_2 M g_x + 3C_3 M^2(g_x^2 + \alpha_o^2)]$$

where the coefficients $\bar{C}_1$, $\bar{C}_2$, and C_3 are discussed in Ref. 4 and are given by

$$\bar{C}_1 = M/(M^2 - \sec^2\Lambda)^{1/2}$$

$$\bar{C}_2 = [M^4(\gamma+1) - 4\sec^2\Lambda(M^2-\sec^2\Lambda)]/4(M^2-\sec^2\Lambda)^2$$

$$C_3 = (\gamma+1)/12$$

and the dimensionless harmonic disturbance downwash v is

$$v = \frac{dh}{dx} + ik\frac{h}{b}$$

If the secant of the sweep angle Λ of the leading edge is taken as zero the usual piston theory is obtained; if sec Λ is taken as unity no sweep correction is made to the quasi-steady supersonic result.

The necessary derivatives for the calculation of the pressure coefficient are the following.

$$\frac{dh}{dx} = [h'(x)/h_1]h_1 + [h'(x)/h_2]h_2$$

$$+ [h'(x)/h_3]h_3 \quad , \quad 0 \le x \le x_3$$

and

$$\frac{dh}{dx} = [h_c'(x)/h_3]h_3 + [h_c'(x)/h_4]h_4 \quad , \quad x_3 \le x \le c$$

where

$$h'(x)/h_1 = (2x-x_2-x_3)/(x_1-x_2)(x_1-x_3)$$

$$h'(x)/h_2 = (2x-x_1-x_3)/(x_2-x_1)(x_2-x_3)$$

$$h'(x)/h_3 = (2x-x_1-x_2)/(x_3-x_1)(x_3-x_2)$$

$$h_c'(x)/h_3 = -1/(c-x_h)$$

and $$h_c'(x)/h_4 = 1/(c-x_h)$$

For the first airfoil the thickness derivatives are

$$g_{1x}/c = (\tau/2x_m) \quad , \qquad 0 \le x \le x_m$$

$$g_{2x}/c = -(\tau/2)(1-r_h)/(x_h-x_m) \quad , \quad x_m \le x \le x_h$$

$$g_{3x}/c = -(\tau_h/2)(1-r_t)/(c-x_h) \quad , \quad x_h \le x \le c$$

and for the second airfoil they are

$$g_{1x}/c = (\tau/x_m)(1-x/x_m) \quad , \qquad 0 \le x \le x_m$$

$$g_{2x}/c = -\tau(1-r_h)(x-x_m)/(x_h-x_m)^2 \quad , \quad x_m \le x \le x_h$$

$$g_{3x}/c = -(\tau_h/2)(1-r_t)/(c-x_h) \quad , \qquad x_h \le x \le c$$

We may write the downwash as

$$v_1 = [v(x)/h_1]h_1 + [v(x)/h_2]h_2 + [v(x)/h_3]h_3 \quad , \quad 0 \le x \le x_h$$

and

$$v_c = [v_c(x)/h_3]h_3 + [v_c(x)/h_4]h_4 \quad , \quad x_h \le x \le c$$

where

$$\begin{aligned} v(x)/h_i &= h'(x)/h_i + i(k/b)h(x)/h_i \quad , \quad i = 1,2,3 \\ &= 0 \quad , \quad i = 4 \end{aligned}$$

and

$$\begin{aligned} v_c(x)/h_i &= 0 \quad , \quad i = 1,2 \\ &= h_c'(x)/h_i + i(k/b)h_c(x)/h_i \quad , \quad i = 3,4 \end{aligned}$$

Then the pressure coefficients in the three airfoil regions are

$$C_{p1} = -(4v/M)[\bar{C}_1 + 2\bar{C}_2 M g_{1x} + 3C_3 M^2 (g_{1x}^2 + \alpha_o^2)]$$

$$C_{p2} = -(4v/M)[\bar{C}_1 + 2\bar{C}_2 M g_{2x} + 3C_3 M^2 (g_{2x}^2 + \alpha_o^2)]$$

$$C_{p3} = -(4v_c/M)[\bar{C}_1 + 2\bar{C}_2 M g_{3x} + 3C_3 M^2 (g_{3x}^2 + \alpha_o^2)]$$

From the principle of virtual work as applied in Ref. 5 and from the definition of the AICs the control point forces F_i are

$$\begin{aligned} F_i &= q\Delta y\Big\{\int_o^{x_m} C_{p1}[h(x)/h_i]\,dx + \int_{x_m}^{x_h} C_{p2}[h(x)/h_i]\,dx \\ &\quad + \int_{x_h}^{c} C_{p3}[h_c(x)/h_i]\,dx\Big\} \quad ; \quad i = 1,2,3,4 \\ &= \rho\omega^2 b_r^2 s \sum_{j=1}^{4} (C_h)_{ij} h_j \end{aligned}$$

Therefore, the elements of the fourth order AIC matrix elements for the strip are

$$\begin{aligned} (C_h)_{ij} = -(2/M)(1/k_r^2)(\Delta y/s)\Bigg\{&(\bar{C}_1 + 3C_3M^2\alpha_o^2)\Bigg(\int_o^{x_h} [h(x)/h_i][v(x)/h_j]\,dx \\ &+ \int_{x_h}^{c} [h_c(x)/h_i][v_c(x)/h_j]\,dx\Bigg) \\ &+ 2\bar{C}_2 M\Bigg(\int_o^{x_m} g_{1x}[h(x)/h_i][v(x)/h_j]\,dx + \int_{x_m}^{x_h} g_{2x}[h(x)/h_i][v(x)/h_j]\,dx \\ &+ \int_{x_h}^{c} g_{3x}[h_c(x)/h_i][v_c(x)/h_j]\,dx\Bigg) \\ &+ 3C_3M^2\Bigg(\int_o^{x_m} g_{1x}^2[h(x)/h_i][v(x)/h_j]\,dx + \int_{x_m}^{x_h} g_{2x}^2[h(x)/h_i][v(x)/h_j]\,dx \\ &+ \int_{x_h}^{c} g_{3x}^2[h_c(x)/h_i][v_c(x)/h_j]\,dx\Bigg)\Bigg\} \end{aligned}$$

where we note that $i,j = 1,2,3$, and 4 and also that $h(x)/h_i = 0$ for $i = 4$, $h_c(x)/h_i = 0$ for $i = 1$ and 2. We define the following definite integrals

$$R_{ij}^{(n)}(\xi,\eta) = i(k/b)I_{ij}^{(n)}(\xi,\eta) = \int_{\xi}^{\eta} g_x^n(x)[h(x)/h_i][v(x)/h_j]\,dx$$

so that

$$R_{ij}^{(n)}(\xi,\eta) = \int_{\xi}^{\eta} g_x^n(x)[h(x)/h_i][h'(x)/h_j]\,dx$$

and

$$I_{ij}^{(n)}(\xi,\eta) = \int_{\xi}^{\eta} g_x^n(x)[h(x)/h_i][h(x)/h_j]\,dx$$

Then the AIC becomes

$$\begin{aligned}(C_h)_{ij} = -(2/M)(1/k_r^2)(\Delta y/s)\Big\{&(\bar{C}_1+3C_3M^2\alpha_o^2)[R_{ij}^{(o)}(0,x_m) \\ &+ i(k/b)I_{ij}^{(o)}(0,x_m) + R_{ij}^{(o)}(x_m,x_h) + i(k/b)I_{ij}^{(o)}(x_m,x_h) \\ &+ R_{cij}^{(o)}(x_h,c) + i(k/b)I_{cij}^{(o)}(x_h,c)] + 2\bar{C}_2M[R_{ij}^{(1)}(0,x_m) + i(k/b)I_{ij}^{(1)}(0,x_m) \\ &+ R_{ij}^{(1)}(x_m,x_h) + i(k/b)I_{ij}^{(1)}(x_m,x_h) \\ &+ R_{cij}^{(1)}(x_h,c) + i(k/b)I_{cij}^{(1)}(x_h,c)] \\ &+ 3C_3M^2[R_{ij}^{(2)}(0,x_m) + i(k/b)I_{ij}^{(2)}(0,x_m) + R_{ij}^{(2)}(x_m,x_h) + i(k/b)I_{ij}^{(2)}(x_m,x_h) \\ &+ R_{cij}^{(2)}(x_h,c) + i(k/b)I_{cij}^{(2)}(x_h,c)]\Big\}\end{aligned}$$

where $i,j = 1,2,3$, and 4, and we note that $R_{ij} = I_{ij} = 0$ if i or $j = 4$, and $R_{cij} = I_{cij} = 0$ if i or $j = 1$ or 2.

3.2 PROGRAM DESCRIPTION

A general program to calculate a set of aerodynamic influence coefficients using piston theory has been developed. The method is applicable to wings of moderate to high aspect ratio and speeds in the supersonic regime. The analysis can be performed for wings with a rigid chord or a flexible chord. The effects of a flexible chord are accounted for by the introduction of parabolic cambering. Parabolic camber is induced if a bending mode is parabolic and if a torsion mode is linear in the region surrounding the strip under consideration. The analysis can be performed with or without a control surface. The steady state case is available as a limiting case of the oscillating case for use in static aeroelastic analysis. The AICs relate the aerodynamic forces to the surface deflections through the following definitions. In the oscillatory case,

$$\{F\} = \rho w^2 b_r^{\,2} s \left[C_h\right] \{h\}$$

and in the steady case,

$$\{F_s\} = (\tfrac{1}{2})\, \rho V^2\, (S/\bar{c}) \left[C_{hs}\right] \{h\}$$

The AICs are derived for each strip considering the airfoil to have up to four degrees of freedom: pitching, plunging, cambering, and control surface rotation. The program provides the AICs in printed and optional punched-card output format. The punched-card output format is identical to that required as input into the COFA, Collocation Flutter Analysis Program (Ref.1). The program capacity is 25 surface strips and 15 variations of Mach Number. There can be as many as 20 reduced velocities for each Mach Number.

3.2.1 PROCESSING INFORMATION

A. OPERATION

Standard FORTRAN IV processor system.
Operable on the GE 635 computer.

B. CORE STORAGE

The program STRIP requires a minimum of 20,000 memory units for executuib,

C. ADDITIONAL MACHINE COMPONENTS

Standard FORTRAN input tape (5)
Standard FORTRAN output print tape (6)
Standard FORTRAN output punch tape.

3.3 PROGRAM INPUT INSTRUCTIONS

UNITS Since all of the input dimensions are geometrical and the aerodynamic Matrix is dimensionless, only a consistent set of length units is necessary - inches or feet.

DATA DECK SETUP

1. Title Card 1
2. Title Card 2
3. NVAN, NCAM, NFOIL, NALPHA, NTAUS
4. ISZ, MSZ, NOPUNJ, JSIZE
5. sec λ, br, s, S, $\bar{c}$
6. Δy, b, ζ_1, ζ_2, ζ_3, ζ_m for each strip
7. τ, τ_h, τ_t for each strip
8. Mach Number Series
9. Alpha Series
10. 1/kr Series

Item 1 Title Card (Any alphanumeric character Columns 1-80)

Item 2 Title Card (Any alphanumeric character Columns 1-80)

Item 3 Control Card (Format 1814)

Field	1	2	3	4	5
Name	NVAN	NCAM	NFOIL	NALPHA	NTAUS
Column	1-4	5-8	9-12	13-16	17-20

NVAN = 0 No Van Dyke Correction Included
= 1 Van Dyke Correction Factor

NCAM = 0 No Camber Effects Included
= 1 Camber Effects Included

NFOIL = 1 Airfoil 1 (See Figure 3.1.2)
= 2 Airfoil 2 (See Figure 3.1.3)

NALPHA = 1 Angle of Attack, Alpha is constant for each strip
= ISZ Angle of Attack, Alpha varies with each strip

NTAUS = 1 Airfoil Thickness is identical for each strip
= ISZ Airfoil Thickness varies for each strip

Item 4 Control Card (Format 18I4)

Field	1	2	3	4	5
Name	ISZ	MSZ	NOPUNJ	$JSIZE_1$	$JSIZE_2$
Column	1-4	5-8	9-12	13-16	

ISZ = Number of strips; ≤ 25

MSZ = Number of Mach Numbers; ≤ 15

NOPUNJ = 0 Output Punched
= 1 No Output Punched

$JSIZE_1$ = Number of Reduced Velocities, $(V/b\omega)$, ≤ 20 for each Mach Number "i" where i = 1 to MSZ;

Item 5 Data Card (Format 6E12.8)

Field	1	2	3	4	5
Name	SECLAM	BR	S	CAPS	CBAR
Column	1-12	13-24	25-36	37-48	49-60

SECLAM = Secantλ where λ is the leading edge sweepback angle

BR = Reference Semi-Chord

S = Reference Semi-Span

CAPS = Total Planform Area, CAPS = $\sum_{1}^{ISZ} 2\Delta yb$

CBAR = Mean Aerodynamic Chord

Item 6 Data Card (Format 6E12.8) Repeat for each strip.

Field	1	2	3	4	5	6
Name	DELTAY	B	Z1	Z2	Z3	ZM
Column	1-12	13-24	25-36	37-48	49-60	61-72

DELTAY = Δy, Strip Width

b = B ~ Strip Semi-Chord

ζ_1 = Z1 ~ Fraction of Chord to First Control Point

ζ_2 = Z2 ~ Fraction of Chord to Second Control Point (Use negative if there is a control surface on this particular strip)

ζ_3 = Z3 ~ Fraction of Chord to Third Control Point (Use hinge line coordinate if there is a control surface on this particular strip)

ζ_m = ZM ~ Fraction of chord at maximum thickness point on the airfoil

Item 7 Data Card (Format 6E12.8)

Field	1	2	3	4	5	6
Name	TAU_1	$TAUH_1$	$TAUT_1$	TAU_2	$TAUH_2$	$TAUT_2$
Column	1-12	13-24	25-36	37-48	49-60	61-72

TAU ~ Maximum Airfoil Thickness Divided by the Local Strip Chord Length

TAUH ~ Airfoil Thickness at Control Surface Hinge Divided by the Local Strip Chord Length; if there is no control surface set TAUH = 0.0

TAUT ~ Airfoil Thickness at Trailing Edge Divided by the Local Strip Chord Length.

Repeat for each strip consecutively; two strips per card; continue on successive cards as necessary.

Item 8 Data Card (Format 6E12.8)

Field	1	2	3	4	5	6
Name	$EMACH_1$	$EMACH_2$	. . .	. . .	$EMACH_{MSZ}$	
Column	1-12	13-24	25-36	37-48	49-60	61-72

EMACH ~ Mach Number

Continue on next card as necessary

Item 9 Data Card (Format 6E12.8)

Repeat this card or Series of Cards for each Mach Number when NALPHA = 1

Field	1	2	3	4	5	6
Name	ALPHA					
Column	1-12	13-24	25-36	37-48	49-60	61-72

ALPHA = Angle of attack, α. ALPHA is constant for each strip. Repeat this card MSZ times.

When NALPHA = ISZ

Field	1	2	3	4	5	6
Name	ALPHA_1	ALPHA_2	. . .	. . .	$\text{ALPHA}_{\text{ISZ}}$	
Column	1-12	13-24	25-36	37-48	49-60	61-72

ALPHA = Angle of attack, α. ALPHA varies for each strip. Continue ALPHA_1 on next card if necessary. Repeat this card or series of cards MSZ times. (Start new card for each Mach Number)

Item 10 Data Card (Format 6E12.8)

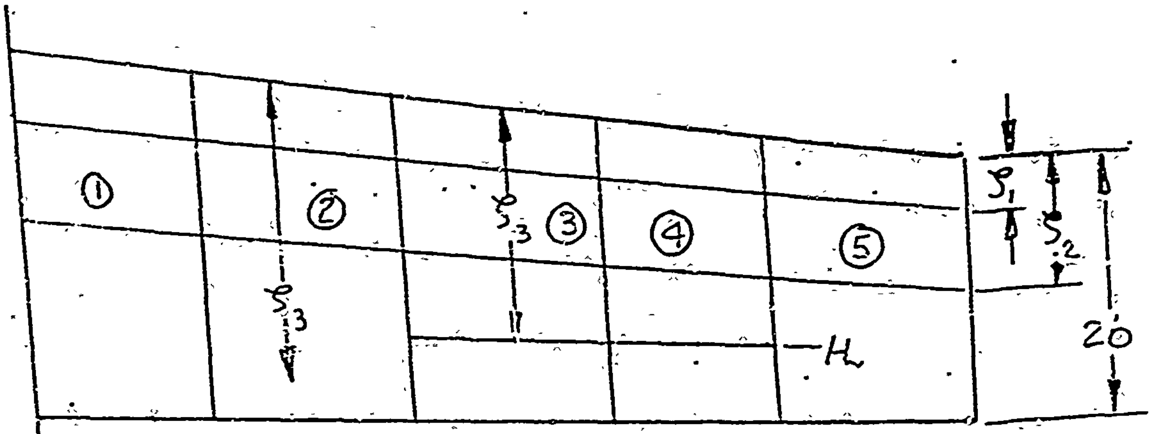
Field	1	2	3	4	5	6
Name	EKR_1	EKR_2	. . .	. . .	EKR_{JSIZE}	
Column						

EKR_i = Reduced Velocity Series; continue on next card if necessary. Repeat the above card or series of cards MSZ times.
(Start new card for each Mach Number)

3.4 SAMPLE PROBLEM

As an example problem, the supersonic AIC's are calculated at Mach No. =2.5 for the high aspect ratio swept back wing shown below. The wing is analyzed for airfoil number one with parabolic cambering. The analysis is performed for the reduced frequencies (1/k) of 0.0, 2.0, and 5.0. A 1/k = 0 calculates the aerodynamics associated with stady state flight. A control surface exists on strips 3 and 4.

PROGRAM INPUT DATA



STRIP NO.	Δy	b(ft)	ζ_1	ζ_2	ζ_3	ζ_{max}
1	3.0	4.0	.25	.45	.8	.35
2	3.0	4.0	.25	.45	.8	.35
3	3.0	4.0	.25	-.45	.8	.35
4	3.0	3.75	.25	-.45	.8	.35
5	3.0	3.75	.25	.45	.8	.35

$\cos\Lambda = 0$

$b_r = 4.5$ ft

$s = 12.0$ ft

$S = 96$ ft^2

$\bar{c} = 5.0$ ft

$1/k_r = 5.0, 2.0, 0.0$

$M = 2.5$

ζ_1, ζ_2, and ζ_3 may be any arbitrary position when no control surface is present; when a control surface is present, ζ_1 and ζ_2 may be arbitrarily located and ζ_3 must be located at the hinge line. In both cases, however, ζ_1, ζ_2, and ζ_3 should be distributed across the chord so that the clamber can be properly defined, e.g., $\zeta_1 = .20$, $\zeta_2 = .50$, and $\zeta_3 = .80$.

NOTE: Negative ζ_2 for strips 3 and 4 indicates a control surface on these strips.

$      FORTRAN DECK
CHAIN        PROGRAM PISTON - AERODYNAMIC INFLUENCE COEFFICIENTS BY
C                          PISTON THEORY
C      WITH OR WITHOUT CAMBER
C      WITH OR WITHOUT A CONTROL SURFACE
C      NCAM = 0, CAMBER NOT CONSIDERED     NCAM = 1, CAMBER INCLUDED
C      NFOIL = 1 OR 2 INDICATES WHICH AIRFOIL IS TO BE CONSIDERED.
C      NVAN IS THE CONTROL FOR THE VAN DYKE CORRECTION OPTION FOR USE
C      WITH LOWER SUPERSONIC MACH NOS. AT LOW REDUCED FREQUENCIES.
C      NVAN = 0, OPTION NOT EXECUTED     NVAN = 1, OPTION EXECUTED
C      Z1,Z2 AND Z3 ARE PERCENT CHORDS OF 1ST,2ND AND 3RD CONTROL POINTS
C      IN EACH STRIP.
C      A NEGATIVE Z2 INDICATES PRESENCE OF A CONTROL SURFACE ON THE STRIP.
C      THE 3RD C.P. MUST BE AT HINGE LINE IF THERE IS A CONTROL SURFACE.
